**EXPERIMENT 3: Develop a flowchart in Figma depicting the operation of a Network Switching Subsystem in a mobile cellular system.**

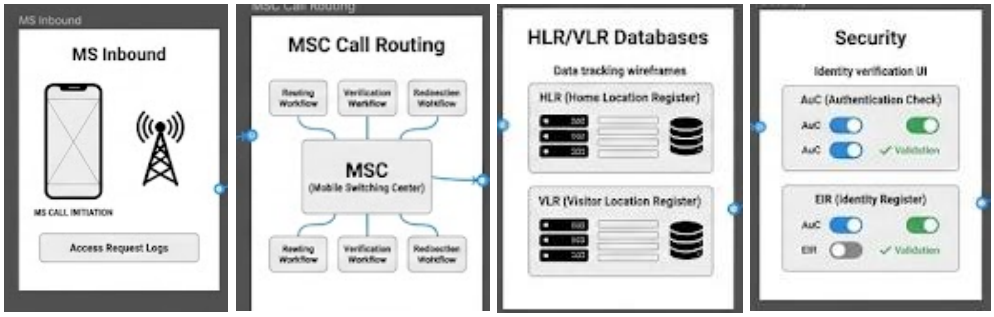

**Aim:**

To develop an interactive flowchart prototype in Figma depicting the operation of a Network Switching Subsystem (NSS) in a mobile cellular system across multiple interconnected modules.

**Procedure:**

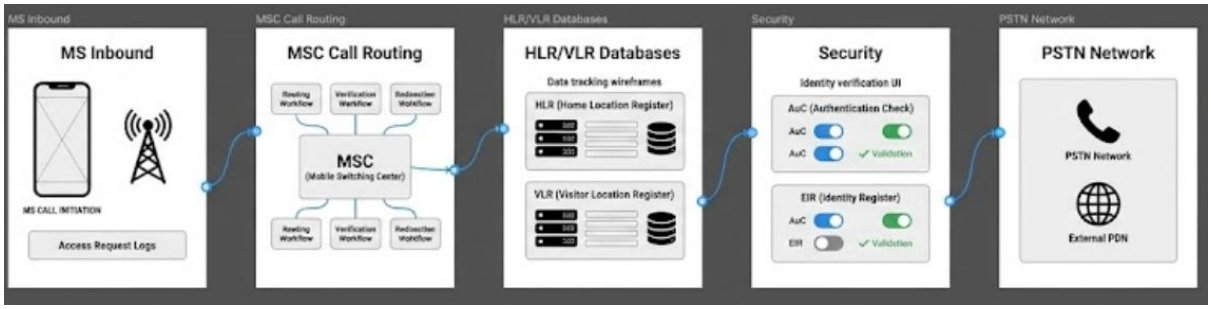

1. **Setup File:** Open Figma and create a new design file.
2. **Create Frames:** Insert five distinct desktop frames and name them sequentially (e.g., MS Inbound, MSC Call Routing, HLR/VLR Databases, Security, PSTN Network).
3. **Design Nodes:** On each frame, design the specific components for that stage of the NSS operation using shapes, text, and icons.
4. **Map the Flow:** Detail the central role of the MSC in routing calls and querying databases (HLR, VLR, AuC, EIR) across the respective frames.
5. **Add Triggers:** Create buttons or interactive zones on each frame to act as navigation triggers.
6. **Enable Prototyping:** Switch to the "Prototype" tab in the right-hand sidebar.
7. **Link Frames:** Click and drag the circular prototype nodes from the interactive elements on one frame to the next logical frame in the sequence to establish the flow.
8. **Configure Animations:** Set the interaction details (e.g., "On click" -> "Navigate to" -> "Smart Animate") for smooth transitions between the subsystems.
9. **Test Prototype:** Click the "Present" (Play) icon to test the interactive sequence and ensure no frames are cut off in the display.
10. **Finalize:** Review the layout, adjust constraints or padding if necessary, and save the project.

**Diagram:**

**Prototype:**

**Result:**

The interactive flowchart depicting the operation of the Network Switching Subsystem (NSS) was successfully developed in Figma. The final prototype utilizes multiple dedicated frames connected via sequential prototyping paths, effectively illustrating the step-by-step call routing and authentication process from the Mobile Station to the External Network.
