EXPERIMENT 5: Design a wireframe for a mobile application that incorporates localization features using Figma

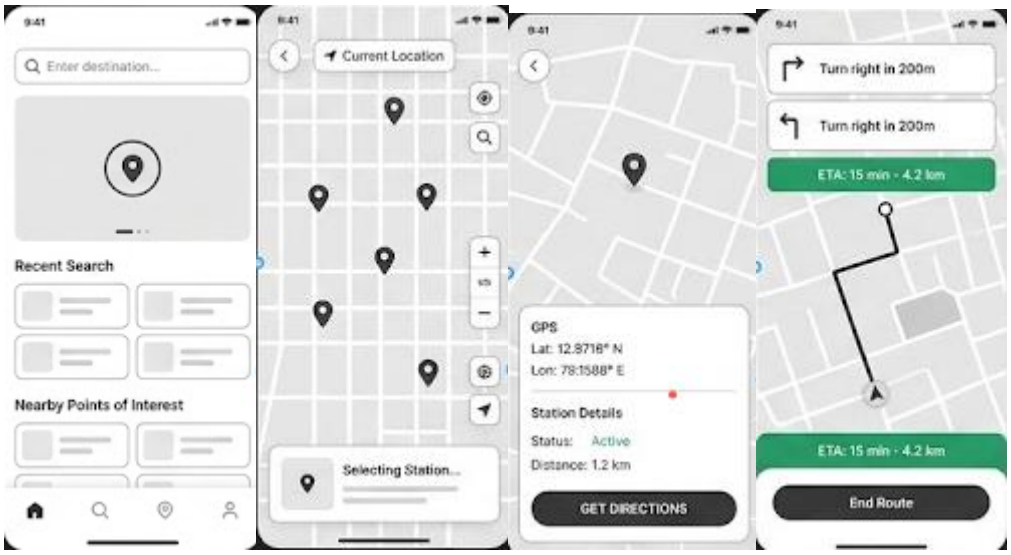

Aim:

To design an interactive wireframe for a mobile application incorporating localization features (such as GPS tracking, map interfaces, and base station routing) using Figma.

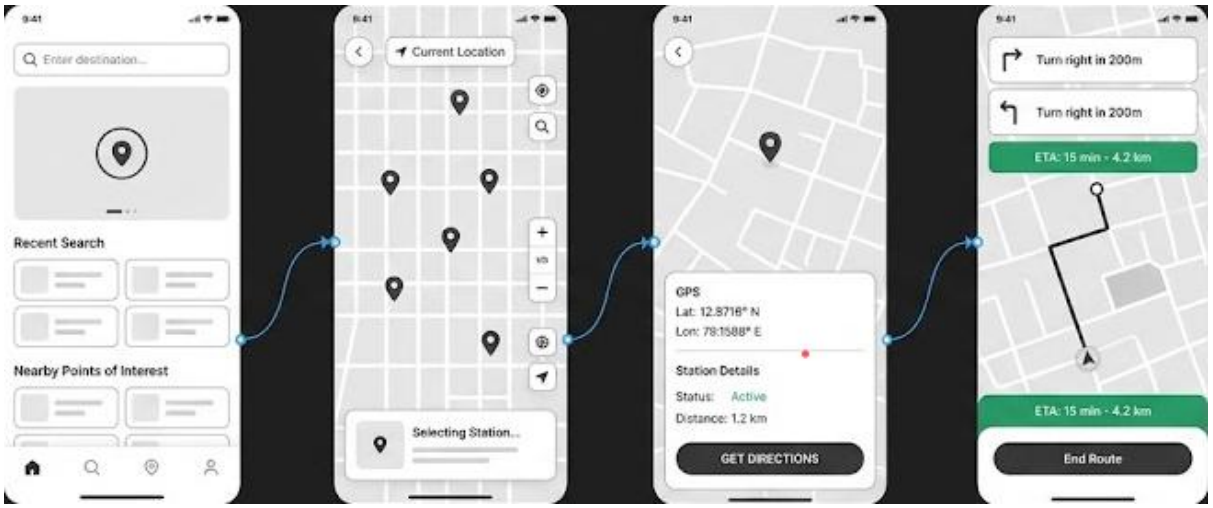

Procedure:

1. **Setup Workspace:** Open Figma, create a new design file, and set up a dark workspace canvas.
2. **Create Mobile Frames:** Select the Frame tool and insert four standard mobile screens (e.g., iPhone 14). Arrange them horizontally and name them sequentially: *Home Search, Map View, Location Details, Navigation Route*.
3. **Design Wireframe Elements:** Use basic shape tools (rectangles, ellipses, lines) to draft the UI structure. Add placeholders for images, search bars, and navigation menus.
4. **Incorporate Localization Features:**
    - On Frame 1, add a search bar for entering destinations.
    - On Frame 2, design a map placeholder grid and drop location pin icons representing the user and nearby base stations.
    - On Frame 3, create data cards displaying specific localization metrics like GPS Latitude/Longitude and signal strength (dBm).
    - On Frame 4, draw a polyline on the map grid to represent the routed path.
5. **Add Interactive Triggers:** Create buttons such as "Search," "View Details," and "Find Route" to act as navigational anchors.
6. **Link the Flow (Prototyping):** Switch to the "Prototype" tab in the right-hand panel. Click and drag the blue circular prototype nodes from the buttons on one mobile frame to the subsequent frame in the flow.
7. **Configure Transitions:** Set the interaction details to "On tap -> Navigate to -> Push" to mimic standard mobile screen transitions.
8. **Test Prototype:** Click the "Present" (Play) button to test the mobile app flow, ensuring the localization features transition logically from search to map routing.

Diagrams:

Prototype:

Result:

A functional, multi-screen mobile application wireframe incorporating localization features was successfully designed in Figma. The prototype effectively demonstrates a seamless, tap-driven navigational flow connecting location search, map views, GPS coordinate data, and routing features across interconnected mobile frames.
